

CS1111 - The Abstract Machine Hierarchy

System Software

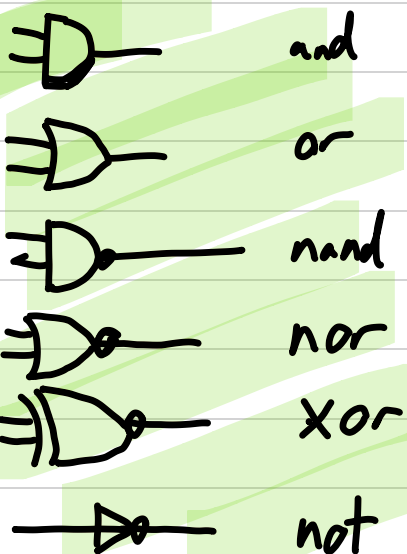

- Layers of software that interpret/translate high level operations into simple computer instructions

System Software:

Operating Systems
Compilers
Loaders - Takes code and puts in memory
Assemblers

- The OS lies between a users program and the hardware and provides a variety of services and supervisory functions.

- Handles basic I/O ops
- Allocates storage & memory
- Sharing of computer resources between multiple concurrent applications

Logic Gates (L0)

MicroArchitecture (L1)

- Registers
- Control Unit
- ALU
- Data Path (connects registers to ALU or CU)

"Collection of components that have a specific use"
